

Product Data

AQUAZONE™ 50PSH, PSV, PSD018-070 Single-Stage Water Source Heat Pumps with PURON® Refrigerant

1 1/2 to 6 Nominal Tons

Well exceeds
ASHRAE 90.1 and
Energy Star Standards.

Single-package horizontally and vertically mounted water source heat pumps with electronic controls offer:

- Non-ozone depleting Puron R-410A refrigerant
- State-of-the-art ECM variable speed blower motor option
- Stainless steel drain pan
- E-coated air coil available
- Mute package for quieter operation available
- Versatility: apply to commercial boiler/cooling tower or geothermal applications (select extended range option for use in geothermal applications)
- Performance certified to ARI/ISO 13256-1:1998
- Flexible and reliable controls to include LON Protocol
- Modulating hot water reheat (HWR) available for dehumidification capability

Features/Benefits

Carrier's Aquazone single-stage water source heat pump with Puron refrigerant is a high quality, efficient solution for all boiler/tower and geothermal applications.

Operating efficiency

Carrier horizontal and vertical water source heat pumps (WSHPs) are designed for quality and high performance over a lifetime of operation. Single-stage WSHP models with Puron refrigerant offer cooling EERs (Energy Efficiency Ratios) to 28.1 and heating COPs (Coefficient of Performance) to 5.9. All efficiencies stated are in accordance with standard conditions under ISO (International Organization for Standardization) Standard 13256-1:1998 and provide among the highest ratings in the industry, exceeding ASHRAE (American Society of Heating, Refrigerant and Air Conditioning Engineers) 90.1 Energy Standards.

Features/Benefits (cont)

High quality construction and testing

All units are manufactured to meet extensive quality control protocol from start to finish through an automated control system, which provides continuous monitoring of each unit and performs quality control checks as equipment progresses through the production process. Standard construction features of the Carrier Aquazone™ units include:

Cabinet — Standard unit fabrication consists of heavy gage galvanized sheet metal cabinet construction designed for part standardization (i.e., minimal number of parts) and modular design. Compressor section interior surfaces are lined with 1/2 in. thick, dual density, 1³/₄ lb per cubic ft acoustic type fiberglass insulation. Air-handling section interior surfaces are lined with 1/2 in. thick, single density, 1³/₄ lb per cubic ft foil-backed fiber insulation for ease of cleaning. Insulation placement is designed to eliminate any exposed edges to prevent the introduction of glass fibers into the airstream. Horizontal and vertical water source heat pumps are fabricated from heavy gage G90 galvanized steel with a powder coat paint finish. Compact cabinet dimensions are designed to fit tight space limitations in both horizontal and vertical configurations.

Compressor — Aquazone 50PS single-stage units include a rotary compressor in size 018 and a scroll compressor in sizes 024-070. Puron® refrigerant, single-stage models offer a dual level vibration isolation system. The compressor is mounted on computer selected vibration isolation springs to a large heavy gage compressor mounting tray plate, which is then isolated from the cabinet base with rubber grommets for maximized vibration attenuation. The compressor has thermal overload protection and is located in an insulated compartment away from the airstream to minimize sound transmission.

ARI/ISO labels — Aquazone units have ARI (Air Conditioning & Refrigeration Institute)/ISO, NRTL (Nationally Recognized Testing Lab), or ETL labels and are factory tested under normal operating conditions at nominal water flow rates. Quality assurance is provided via testing report cards shipped with each unit to indicate specific unit performance under cooling and heating modes of operation.

Blower and motor assembly — Aquazone 50PS units are available with permanent split capacitor (PSC), high-static PSC or electronically controlled motors (ECM).

NOTE: The ECM blower motors are not available in 575v units. The PSC and high-static PSC blower motors, when used with a Thermidistat™ and/or a humidistat and the Deluxe D controls, allow for intelligent fan speed reduction to provide the IdealHumidity™ system. The ECM blower motor, when used with a Thermidistat and/or a humidistat (and any controller), also allows for intelligent fan speed reduction to provide the IdealHumidity system. Carrier variable-speed blower systems work in concert with Carrier's Thermidistat and/or humidistat control to remove more moisture than a standard system, making the occupants feel cool and more comfortable.

Refrigeration/water circuit — All units contain sealed Puron (R-410A) refrigerant circuits including a high-efficiency hermetic compressor designed for heat pump operation, a thermostatic expansion valve for refrigerant metering, an enhanced corrugated aluminum-lanced fin and rifled copper tube refrigerant-to-air heat exchanger, reversing valve, coaxial (tube-in-tube) refrigerant-to-water heat exchanger, and safety controls including a high-pressure switch, low-pressure switch, water coil low temperature sensor, and air coil low temperature sensor.

Quiet operation

Fan motor insulation and double isolated compressor are provided for sound isolation, cabinets are fully insulated to reduce noise transmission, low speed blowers are utilized for quiet operation through reduced outlet air velocities, and air-to-refrigerant coils are designed for lower airflow coil face velocities. Additional sound mitigation can be attained with the mute package option.

Puron® refrigerant

Puron refrigerant is a non-chlorine based (R-410A) refrigerant. Puron refrigerant characteristics, compared to R-22, have:

- Binary and near azeotropic mixture of 50% R-32 and 50% R-125.
- Higher efficiencies (50 to 60% higher operating pressures).
- Non-ozone depleting potential and low global warming potential.
- Virtually no glide. Unlike other alternative refrigerants, the two components in Puron have virtually the same leak rates. Therefore, refrigerant can be added if necessary without recovering the charge.

E-coated (electro-coated) air coils

Carrier's 50PSH, PSV, PSD units are available with an optional E-coated air coil. This electro-coating process will provide years of protection against corrosion from airborne chemicals. Modern building materials, such as counter-tops, floor coverings, paints and other materials, can "outgas" chemicals into the indoor air. Some of these chemicals are suspected of contributing to corrosion in the air coils found in both traditional and geothermal heating and cooling equipment. Corrosion often results in refrigerant leaks and eventual failure of the air coil, costing hundreds of dollars to replace. Studies have also shown that these air coil coatings improve moisture shedding and therefore, improve a units moisture removal capability resulting in a more comfortable indoor environment. The 50PSH, PSV, PSD units assure both maximum air coil life and comfort.

Design flexibility

Airflow configurations for horizontal units are available in four patterns including left or right return, and left,

right, or back discharge. Horizontal and downflow units are field convertible from left or right discharge to back discharge. Vertical units are available in three airflow patterns including top discharge with right or left return. Standard entering water temperature is between 60 and 95 F. Extended entering water temperature range between 20 and 120 F offers maximum design flexibility for all applications. Water flow rates as low as 1.5 gpm per ton assist with selection from a various range of circulating pumps. Factory-installed options are offered to meet specific design requirements.

Safe, reliable operation

Standard safety features for the refrigerant circuit include high-pressure switch, low-pressure sensor to detect loss of refrigerant, and low air temperature sensor to safeguard against freezing. Equipment safety features include water loop temperature monitoring, voltage protection, water coil freeze protection, and standard electronic condensate overflow shutdown. All safety features are tested and run at the factory to assure proper operation of all components and safety switches.

All components are carefully designed and selected for endurance durability, and carefree day-to-day operation.

The Aquazone™ unit is shipped to provide internal and external equipment protection. Shipping supports are placed under the blower housing and compressor feet. In addition, horizontal and vertical units are both mounted on oversized pallets with lag bolts for sturdiness and maximum protection during transit.

Ease of installation

The Aquazone unit is packaged for simple low cost handling, with minimal time required for installation. All units are pre-wired and factory charged with refrigerant. Horizontal units are provided with factory-installed hangar isolation brackets. Vertical units are provided with an internally trapped condensate drain to reduce labor associated with installing an external trap for each unit. Water connections (FPT) and condensate drains (FPT) are anchored securely to the unit cabinet, eliminating the need for backup wrenches.

Simple maintenance and serviceability

The Aquazone water source heat pump (WSHP) units are constructed to provide ease of maintenance. Units allow access to the compressor section from 3 sides and have large removable panels for easy access. Additional panels are provided to access the blower and control box sections.

The blower housing assembly can be serviced without disconnecting ductwork from the dedicated blower access panel. Blower units are provided with permanently lubricated bearings for worry-free performance. Blower inlet rings allow removal of the blower wheel without having to remove the housing or ductwork connections.

Electrical disconnection of the blower motor and control box is easily accomplished from quick disconnects on each component.

Easy removal of the control box from the unit provides access to all refrigeration components.

The refrigeration circuit is easily tested and serviced through the use of high and low pressure ports integral to the refrigeration circuit.

Maximum control flexibility

Aquazone water source heat pumps provide reliable control operation using a standard microprocessor board with flexible alternatives for many direct digital control (DDC) applications including the Carrier Comfort Network® (CCN) and open protocol systems.

Carrier's Aquazone standard unit solid-state control system, the Complete C, provides control of the unit compressor, reversing valve, fan, safety features, and troubleshooting fault indication features. The Complete C is one of the most user friendly, low cost, and advanced control boards found in the WSHP industry. Many features are field selectable to provide the ultimate in field installation flexibility. The overall features of this standard control system include:

50 va transformer — The transformer assists in accommodating accessory loads.

Anti-short cycle timer — Timer provides a minimum off time to prevent the unit from short cycling. The 5-minute timer energizes when the compressor is

Features/Benefits (cont)

deenergized, resulting in a 5-minute delay before the unit can be restarted.

Random start relay — Random start relay ensures a random delay in energizing each different WSHP unit. This option minimizes peak electrical demand during start-up from different operating modes or after building power outages.

High and low pressure refrigerant protection — This protection safeguards against unreliable unit operation and provides a warning for refrigerant leaking.

Condensate overflow sensor

The electronic sensor is mounted to the drain pan. When condensate pan liquid reaches an unacceptable level, unit is automatically deactivated and placed in a lockout condition. Thirty continuous seconds of overflow is recognized as a fault by the sensor.

High and low voltage protection

— Safety protection for excessive or low voltage conditions is included.

Automatic intelligent reset — Unit will automatically restart 5 minutes after shutdown if the fault has cleared. Should a fault occur 3 times sequentially, lockout will occur.

Accessory output — Twenty-four volt output is provided to cycle a motorized water valve or damper actuator with compressor in applications such as variable speed pumping arrangements.

Performance Monitor (PM) —

Unique feature monitors water temperatures to warn when the heat pump is operating inefficiently or beyond typical operating range. Field selectable switch initiates a warning code on the unit display.

Water coil freeze protection (selectable for water or antifreeze) —

Field selectable switch for water and water/glycol solution systems initiates a fault when temperatures exceed the selected limit for 30 continuous seconds.

Air coil freeze protection (check filter operation) — Field selectable switch for assessing excessive filter pressure drop initiates a fault when temperatures exceed the selected limit for 30 continuous seconds.

Alarm relay setting — Selectable 24 v or pilot duty dry contact provides activation of a remote alarm.

Electric heat option — The output provided on the controller operates two stages of emergency electric heat.

Service Test mode with diagnostic LED (light-emitting diode) — The Service Test mode allows service personnel to check the operation of the WSHP and control system efficiently. Upon entering Service Test mode, time delays are sped up, and the Status LED will flash a code to indicate the last fault experienced for easy diagnosis. Based on the fault code flashed by the status LED, system diagnostics are assisted through the use of Carrier provided troubleshooting tables for easy reference to typical problems.

LED visual output — An LED panel indicates high pressure, low pressure, low voltage, high voltage, air/water freeze protection, condensate overflow, and control status.

Carrier PremierLink™ controller adds reliability, efficiency, and simplification

The PremierLink direct digital controller can be ordered as a factory-installed option. Designed and manufactured exclusively by Carrier, the controller can be used to actively monitor and control all modes of operation as well as monitor the following diagnostics and features: unit number, zone temperature, zone set point, zone humidity set point, discharge air temperatures, fan status, stages of heating, stages of cooling, outdoor-air temperature, leaving-air temperature, leaving water temperature, alarm status, and alarm lockout condition.

This controller has a 38.4K baud communications capability and is compatible with *ComfortLink™* controls, CCN and *ComfortVIEW™* software. The scrolling marquee and *Navigator™* display are optional tools that can be used for programming and monitoring the unit for optimal performance. The addition of the Carrier CO₂ sensor in the conditioned space provides ASHRAE 62-99 compliance and demand control ventilation (DCV). A DCV control strategy is especially beneficial for a water source heat pump system to minimize the energy utilized to condition ventilation air. In combination with energy efficient Aquazone units, DCV may be the most energy efficient approach ever developed for a water source heat pump system.

The PremierLink peer-to-peer, Internet ready communicating control is designed specifically for constant volume (CV) and variable volume and temperature (VVT®) applications. This comprehensive controls system allows water source heat pumps to be linked together to create a fully functional HVAC (heating, ventilation, and air conditioning) automation system.

Open protocol for diverse control

— The LON controller option is ideal when building automation requires interoperability across diverse control platforms. This LONMark® compliant offering can operate as standalone or as a part of Local Operating Network (LON) via the LONWORKS® FTI-10 Free Topology communication network. Factory completed pre-engineered applications specific to Aquazone water source heat pumps and digital wall sensors communicating over Sensor Link (S-Link) communication protocol completes a system of networked control.

Humidity control — Aquazone™ 50PSH, PSV, PSD units provide very good latent capacity and are an excellent choice for controlling humidity within a zone in many applications. The latent capacity of the units can be increased based on zone conditions with either the use of fan speed control and a humidistat or with the modulating hot water reheat option. The Deluxe D controls option provides fan speed control based on relative humidity and is an effective, low-cost means of controlling humidity. For certain applications in which a significant amount of latent capacity is required, the modulating hot water reheat option is a good solution.

*Must order Deluxe D when selecting HWR option. Units with the HWR option installed in an open loop application require an internal bronze pump. The cupronickel heat exchanger option, which includes a bronze pump, must be used. Failure to select this option could result in premature equipment failure. HWR is not recommended for applications with poor water quality. The copper heat exchanger with cast iron pump (standard modulating reheat option) is designed for closed loop systems.

Factory-installed options

Cupronickel heat exchangers are available for higher corrosion protection for applications such as open tower, geothermal, etc. Consult the water quality guidelines for proper application and selection of this option.

Sound attenuation package (mute package) is available for applications that require especially low noise levels. With this option, a double application of sound attenuating material is applied, access panels are double dampened with 1/2-in. thick density fiberglass insulation, which is applied to the basepan, and a unique application of special dampening material is applied to the curved portion of the blower. The mute package in combination with standard unit noise reduction features (i.e., as mentioned previously) provides sound levels and noise reduction to the highest degree.

Extended range units have an insulated coaxial coil and insulated refrigerant and water piping to prevent condensation, and therefore potential dripping problems, in applications where the entering water temperature is below the normal operating range (less than 60 F). Units are capable of operating with an entering water temperature range of 20 to 120 F.

Hot water generator coil and 125 F high temperature switch to generate hot water using the unit. Hot water pumps are not provided with this option.

Water circuit options provide internally mounted 2.5 or 3.0 gpm per ton automatic flow regulating valves for easier installation.

Modulating hot water reheat diverts condenser water through a water-to-air coil that is placed after the evaporator coil. The modulating reheat valve automatically adjusts reheat capacity based upon leaving-air temperature and loop entering-water temperature to provide 100% reheat and neutral supply air to the space.

Two-way motorized control valve can be provided for applications involving open type systems or variable speed pumping. This valve will slowly open and close in conjunction with the compressor operation to shut off or turn on water to the unit.

Deluxe D control system provides the same functions as the Complete C control system while incorporating additional flexibility and functions to include:

Thermostat input capabilities accommodate emergency shutdown mode and night setback with override potential. Night setback from low temperature thermostat with 2-hour override is initiated by a momentary signal from the thermostat.

Compressor relay staging is used with dual stage units (units with 2 compressors and 2 Deluxe D controls) or in master/slave applications.

Boilerless electric heat control system allows automatic changeover to electric heat at low loop water temperature.

Intelligent reversing valve operation minimizes reversing valve operation for extended life and quiet operation.

Thermostat type select (Y, O or Y, W) provides ability to work and select heat pump or heat/cool thermostats (Y, W).

Reversing valve signal select (O or B) provides selection for heat pump O/B thermostats.

The IdealHumidity™ system provides operation of fan control for dehumidification operation (units with ECM motor have input on the ECM board; optional Deluxe D board is not required).

Multiple units on one thermostat/wall sensor provides for communication for up to three heat pumps on one thermostat.

Boilerless changeover temperature provides selection of boilerless changeover temperature set point.

Accessory relays allow configuration for multiple applications including fan and compressor cycling, digital night setback (NSB), mechanical night setback, water valve operation, and outside air damper operation.

PremierLink™ controller is compatible with the Carrier Comfort Network® (CCN) and other building automation systems (BAS). This control is designed to allow users the access and ability to change factory-defined settings thus expanding the function of the standard unit.

LONMark® compliant controller contains the factory-loaded Aquazone™ water source heat pump application for an interoperable control solution.

Permanent split capacitor (high static) blower motors enable the 50PS units to increase performance levels in high-static applications.

Electronically controlled motors (ECM) provide soft starting, maintain constant airflow over the motor static

operating range and provides airflow adjustment on the motor control board. The fan motor is isolated from the housing by rubber grommets, is permanently lubricated and has thermal overload protection.

Field-installed accessories

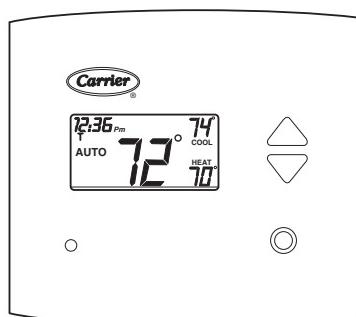

Carrier's line of Aquazone thermostats are both attractive and multi-functional, accommodating stand-alone water source heat pump installations.

Programmable 7-day thermostat — Thermostat offers 2-stage heat, 2-stage cool, auto changeover, 7-day programmable with copy command, 4 settings per day, fully electronic, 24 vac, backlit LCD, keypad lockout, no batteries required, 5-minute compressor protection, NEVERLOST™ memory, 3 security levels, and temperature display in degrees F or C.

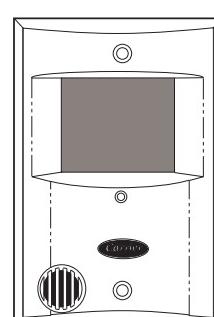

Programmable 7-day light-activated thermostat — Thermostat offers same features as the 7-day programmable thermostat and includes occupied comfort settings with lights on, unoccupied energy savings with lights off.

Programmable 7-day flush-mount thermostat — Thermostat offers same features as the 7-day programmable thermostat and includes locking coverplate with tamper proof screws, flush to wall mount, holiday/vacation programming, set point limiting, dual point with adjustable deadband, O or B terminal, and optional wall or duct-mounted remote sensor.

Options and accessories (cont)

Programmable 5-day thermostat — Thermostat offers 2-stage heat, 2-stage cool, auto changeover, 5-minute built-in compressor protection, locking cover included, temperature display in degrees F or C, keypad lockout, backlit display, 5-1-1 programming, O or B terminal, dual set point with adjustable deadband, configurable display, self-prompting program, and 4 settings per day.

Non-programmable thermostat — Thermostat offers 2 heat stages, 2 cool stages, auto changeover, 5-minute built in compressor protection, locking cover included, temperature display in degrees F or C, keypad lockout, large display, backlit display, O or B terminal, dual set point with adjustable deadband, and backplate with terminals.

Loop controller with six stages (2 stages for heating and 4 stages for cooling) includes:

- Loop temperature alarms
- Two pump single loop flow monitoring with the ability to manually select the lead pump
- One common alarm signal and indicating light and one audible alarm
- Loop water temperature sensor test circuit
- Functional test simulation from operator keypad
- Real timeclock, industrial noise ratings
- Loop water temperature control switch

Filter rack (2 in.) is available in place of the standard 1-in. return air filter to enhance the filtration system of the water source heat pump. The 2-in. filter rack does not include filters.

Fire-rated hoses are 2 ft long and have a fixed MPT on one end and a swivel with an adapter on the other end. Hose kits are provided with both a supply and return hose and can be either stainless steel or galvanized. Two sizes are available (3/4 and 1 in.).

Ball valves (brass body) are used for shutoff and balancing water flow and are available with memory, memory stop, and pressure temperature ports. Ball valves consist of UL-listed brass body, ball and stem type with Teflon seats and seals. Two sizes are available (3/4 and 1 in.).

Y strainers (bronze body) are "Y" type strainers with a brass cap. With a maximum operating pressure rating of 450 psi, the strainer screen is made of stainless steel and is available with blow down valves. Two sizes are available (3/4 and 1 in.).

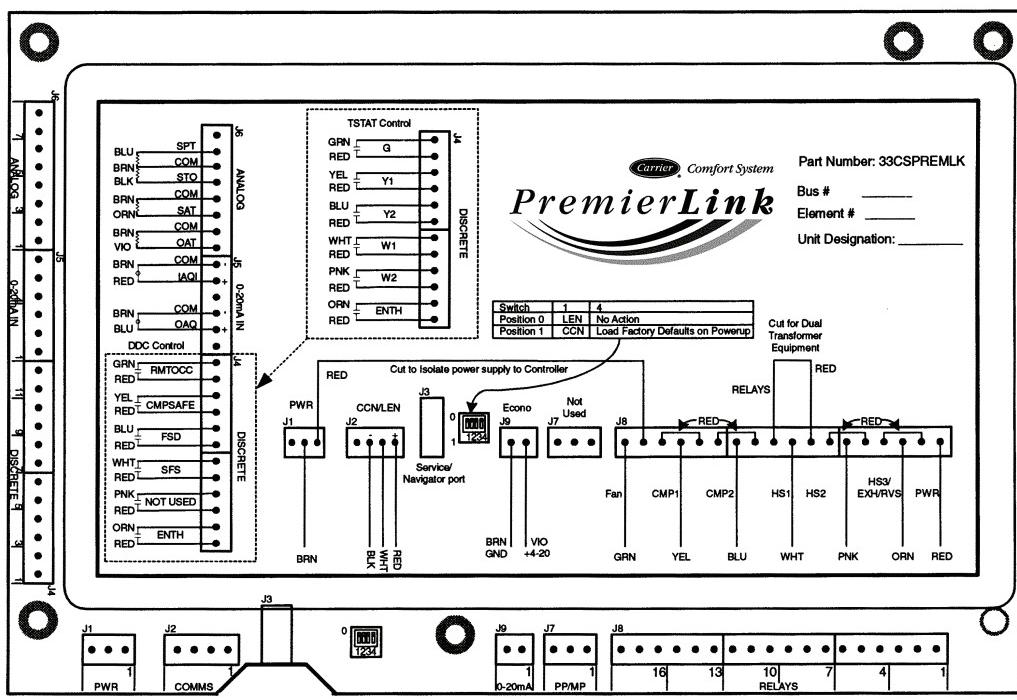

Solenoid valves (brass body) offer 3.5 watt coil, 24 volt, 50/60 Hz, 740 amps inrush, .312 amps holding. Solenoid valves have slow operation for quiet system application. Two sizes are available (3/4 and 1 in.).

Hose kit assemblies provide all the necessary components to hook up a water-side system. Supply hose includes a ported ball valve with pressure temperature (P/T) plug ports, flexible stainless steel hose with swivel and nipple. Return hose includes a ball valve, preset automatic balancing valve (gpm) with two P/T ports, flexible stainless steel hose with a swivel and nipple, balancing valve, and low-pressure drop water control valve.

Remote sensors are available for Aquazone™ flush mount thermostats. Available sensors are for wall (wired and wireless) or duct mounted applications.

PremierLink™ accessories are available for providing a fully integrated WSHP DDC system. Accessories include supply air temperature sensors (with override and/or set point adjustment), communicating room sensors, CO₂ sensors (for use in demand control ventilation), and linkage thermostats (to control multiple units from one thermostat).

Selection procedure (50PSH024 unit example)

I Determine the actual cooling and heating loads at the desired dry bulb and wet bulb conditions.

Assume cooling load at desired dry bulb 80 F and wet bulb 65 F conditions are as follows:

Given:

Total Cooling (TC) 24,000 Btuh
Sensible Cooling (SC) 17,900 Btuh
Entering-Air Temperature db 80.6 F
Entering-Air Temperature wb 65 F

II Determine the following design parameters from Performance Data tables.

Entering water temperature, water flow rate (gpm), airflow (cfm), water flow pressure drop and design wet and dry bulb temperatures. Airflow cfm should be between 300 and 450 cfm per ton. Unit water pressure drop should be kept as close as possible to each other to make water balancing easier. Enter the 50PSH024 Performance Data tables and find the proper indicated water flow and water temperature.

For example:

Entering Water Temperature 90 F
Water Flow (Based upon
12 F rise in temperature) 6.0 gpm
Airflow 748 cfm

III Select a unit based on total cooling and total sensible cooling conditions. Unit selected should be closest to but not larger than the actual cooling load.

Enter Performance Data tables at the design water flow and water temperature. Read the total and sensible cooling capacities.

NOTE: Interpolation is permissible, extrapolation is not.

For example:

Enter the 50PSH024 (PSC Blower) Performance Table at design water flow and water temperature. Read Total Cooling, Sensible Cooling and Heat of Rejection capacities:

Total Cooling 25,200 Btuh
Sensible Cooling 18,400 Btuh
Heat of Rejection 31,100 Btuh
Read the Heat Capacity. If the Heat Capacity exceeds the design criteria, it is acceptable.

NOTE: It is normal for water source heat pumps to be selected on cooling capacity only since the heating output is usually greater than the cooling capacity.

IV Determine the correction factors associated with the variable factors of dry bulb and wet bulb using the correction factor tables found in this book.

Using the following formulas to determine the correction factors of dry bulb and wet bulb:

- Corrected Total Cooling = tabulated total cooling x wet bulb correction x airflow correction.
- Corrected Sensible Cooling = tabulated sensible cooling x wet/dry bulb correction x airflow correction.

V Determine entering air and airflow correction using the correction factor tables found in this book.

The nominal airflow for the 50PSH024 is 850 cfm. The design parameter is 748 cfm.

$$748/350 = 87.5\% \text{ of nominal airflow:}$$

Use the 87.5% row in the Nominal CFM (PSC Airflow) Correction table.

The Entering-Air Temperature is 65 F wb. Use the 65 F row in the Entering Air Correction table.

Using the following formulas to determine the correction factors of entering air and airflow correction:

Table	Ent Air	Airflow	Corrected
Corrected Total Cooling	= 25,200 x 0.971 x 0.983 = 24,053		
Corrected Sensible Cooling	= 18,400 x 1.106 x 0.915 = 18,520		
Corrected Heat of Rejection	= 31,100 x 0.976 x 0.983 = 29,838		

Compare the corrected capacities to the load requirements established in Step I. If the capacities are within 10% of the load requirements, the equipment is acceptable. It is better to undersize than oversize as undersizing improves humidity control, reduces sound levels and extends the life of the equipment.

VI Water temperature rise calculation and assessment.

Calculate the water temperature rise and assess the selection using the following calculation:

$$\frac{\text{Actual Temperature Rise}}{\text{GPM} \times 500} = \frac{\text{Correction of Heat Rejection}}{}$$

For example, using the Corrected Heat of Rejection from the last step:

$$\frac{\text{Actual Temperature Rise}}{6.0 \times 500} = \frac{29,838}{6.0 \times 500} = 9.9 \text{ F}$$

If the units selected are not within 10% of the load calculations, review what effect changing the GPM, water temperature and/or airflow will have on the corrected capacities. If the desired capacity cannot be achieved, select the next larger or smaller unit and repeat Steps I through VI.

Performance data

LEGEND

ARI	Air Conditioning and Refrigeration Institute
COP	Coefficient of Performance
db	Dry Bulb
EER	Energy Efficiency Ratio
EWT	Entering Water Temperature
GPM	Gallons Per Minute
HE	Heat of Extraction (MBtuh)
ISO	International Organization for Standardization
LAT	Leaving Air Temperature (F)
MBtuh	Btuh in thousands
TC	Total Capacity (MBtuh)
THC	Total Heating Capacity (MBtuh)
THR	Total Heat Rejection (MBtuh)
TSC	Total Sensible Capacity (MBtuh)
wb	Wet Bulb

NOTES:

1. Interpolation is permissible; extrapolation is not.
 2. All entering air conditions are 80 F db and 67 F wb in cooling, and 70 F db in heating. ARI/ISO certified conditions are 80.6 F db and 66.2 F wb in cooling and 68 F db in heating.
 3. Table does not reflect fan or pump power corrections for ARI/ISO conditions.
 4. All performance is based upon the lower voltage of dual voltage rated units.
 5. Operation below 40 F EWT is based upon a 15% antifreeze solution.
 6. Operation below 60 F EWT requires optional insulated water/refrigerant circuit.
 7. See performance correction tables for operating conditions other than those listed above.

Performance data (cont)

LEGEND

ARI — Air Conditioning and Refrigeration Institute
COP — Coefficient of Performance
db — Dry Bulb
EER — Energy Efficiency Ratio
EWT — Entering Water Temperature
GPM — Gallons Per Minute
HE — Heat of Extraction (MBtuh)
ISO — International Organization for Standardization
LAT — Leaving Air Temperature (F)
MBtuh — Btuhs in thousands
TC — Total Capacity (MBtuh)
THC — Total Heating Capacity (MBtuh)
THR — Total Heat Rejection (MBtuh)
TSC — Total Sensible Capacity (MBtuh)
wb — Wet Bulb

LEGEND

- ARI — Air Conditioning and Refrigeration Institute
- COP — Coefficient of Performance
- db — Dry Bulb
- EER — Energy Efficiency Ratio
- EWT — Entering Water Temperature
- GPM — Gallons Per Minute
- HE — Heat of Extraction (MBtuh)
- ISO — International Organization for Standardization
- LAT — Leaving Air Temperature (F)
- MBtuh — Btuh in thousands
- TC — Total Capacity (MBtuh)
- THC — Total Heating Capacity (MBtuh)
- THR — Total Heat Rejection (MBtuh)
- TSC — Total Sensible Capacity (MBtuh)
- wb — Wet Bulb

NOTES:

1. Interpolation is permissible; extrapolation is not.
2. All entering air conditions are 80 F db and 67 F wb in cooling, and 70 F db in heating. ARI/ISO certified conditions are 80.6 F db and 66.2 F wb in cooling and 68 F db in heating.
3. Table does not reflect fan or pump power corrections for ARI/ISO conditions.
4. All performance is based upon the lower voltage of dual voltage rated units.
5. Operation below 40 F EWT is based upon a 15% antifreeze solution.
6. Operation below 60 F EWT requires optional insulated water/refrigerant

LEGEND

ESP — External Static Pressure
 HS — High Static

NOTES:

1. Shaded areas denote ESP where operation is not recommended.
2. Units factory shipped on medium speed. Other speeds require field selection.
3. All airflow is rated and shown above at the lower voltage if unit is dual voltage rated, e.g., 208 v for 208/230 v units.
4. Only two-speed fan (high and medium) available on 575 v units.

LEGEND

ESP — External Static Pressure

NOTES:

1. See ECM control section in the Base Unit Installation Instructions for details on setting taps.
2. Factory setting is Tap Setting 2.
3. Airflow is controlled within 5% up to the Max ESP shown with wet coil.
4. Do not select Dehumidification mode if Tap Setting is on Setting 1.
5. All units ARI/ISO 13256-1 rated Tap Setting 3.
6. Airflow in cfm with wet coil and clean air filter.
7. Units have an ECM fan motor as a standard feature. The small additional pressure drop of the reheat coil causes the ECM motor to slightly increase rpm to overcome the added pressure drop and maintain selected cfm up to maximum ESP.

NOTES:

1. Compressor and blower motor thermally protected internally.
 2. All wiring to the unit must comply with NEC and local codes.
 3. 208/230 v transformer will be connected for 208 v operation. For 230 v operation, disconnect RED lead at L1 and attach ORANGE lead to L1. Insulate open end of RED lead. 220/240 v transformer will be connected for 220 v operation. For 240 v operation, disconnect RED lead at L1 and attach ORANGE lead to L1. Insulate open end of RED lead. Transformer is energy limiting or may have circuit breaker.
 4. FP1 thermistor provides freeze protection for water. When using anti-freeze solutions, cut JW3 jumper.
 5. Check installation wiring information for specific thermostat hookup. Refer to thermostat installation instructions for wiring to the unit. Thermostat wiring must be "Class 1" and voltage rating equal to or greater than unit supply voltage.
 6. 24-v alarm signal shown. For dry alarm contact, cut JW1 jumper and dry contact will be available between AL1 and AL2.
 7. Transformer secondary ground via Complete C board standoffs and screws to control box. (Ground available from top two standoffs as shown.)
 8. Aquastat is supplied with unit and must be wired in series with the hot leg to the pump. Aquastat is rated for voltage up to 277 v.
 9. Fan motors factory wired for medium speed. For high and low speed remove BLU wire from fan motor speed tap 'M' and connect to 'H' for high or 'L' for low.

NOTES:

1. Compressor and blower motor thermally protected internally.
2. All wiring to the unit must comply with NEC and local codes.
3. Transformer is wired to 460 v (BLK/RED) lead for 460/60/3 units. 575 v (GRY) lead for 575/60/3. Transformer is energy limiting or may have circuit breaker.
4. FP1 thermistor provides freeze protection for water. When using antifreeze solutions, cut JW3 jumper.
5. Check installation wiring information for specific thermostat hookup. Refer to thermostat installation instructions for wiring to the unit. Thermostat wiring must be "Class 1" and voltage rating equal to or greater than unit supply voltage.
6. 24-v alarm signal shown. For dry alarm contact, cut JW4 jumper and dry contact will be available between AL1 and AL2.
7. Transformer secondary ground via Deluxe D board standoffs and screws to control box. (Ground available from top two standoffs as shown.)
8. Aquastat is supplied with unit and must be wired in series with the hot leg to the pump. Aquastat is rated for voltage up to 277 v.
9. Blower motor is factory wired for high and low speeds. No other combination is available.

TABLE 1		WIRE NUMBER				
Blower Speeds	1	2	3	4	5

LP Fault/(Lockout) Note 1	Slow Flash/Fast Flash	OFF	Flashing Code 3	Open/Closed
FP1 Fault/(Lockout) Note 1	Slow Flash/Fast Flash	OFF	Flashing Code 4	Open/Closed
FP2 Fault/(Lockout) Note 1	Slow Flash/Fast Flash	OFF	Flashing Code 5	Open/Closed
CC Fault/(Lockout) Note 1	Slow Flash/Fast Flash	OFF	Flashing Code 6	Open/Closed
Over-Under Voltage	Slow Flash	OFF	Flashing Code 7	Open (Note 4)
Normal Mode with UPS	ON	OFF	Flashing Code 8	Cycle (Note 5)
Swapped FP1/FP2 Lockout	Fast Flash	OFF	Flashing Code 9	Closed

NOTES:

1. Status LED (GREEN) Slow Flash - Controller In - Fault Retry Mode. Fast Flash - Controller in Lockout Mode. Slow Flash = 1 Flash per every 2 seconds. Fast Flash = 2 Flashes per every 1 second.
2. Fault LED (RED) flashes a code representing last fault in memory. If no fault in memory code 1 is flashed.
3. Cycles appropriate code, by cycling alarm relay in the same sequence as fault LED.
4. Alarm relay closes after 15 minutes.
5. Alarm relay cycles. Closed for 5 seconds and open for 25 seconds.

THREE-PHASE 50PS UNITS WITH COMPLETE C ECM BLOWER

*Optional.

NOTES:

1. Compressor and blower motor thermally protected internally.
2. All wiring to the unit must comply with NEC and local codes.
3. 208/230 v transformer will be connected for 208 v operation. For 230 v operation, disconnect RED lead at L1 and attach ORANGE lead to L1. Insulate open end of RED lead. 220/240 v transformer will be connected for 220 v operation. For 240 v operation, disconnect RED lead at L1 and attach ORANGE lead to L1. Insulate open end of RED lead. Transformer is energy limiting or may have circuit breaker.
4. FP1 thermistor provides freeze protection for water. When using anti-freeze solutions, cut JW3 jumper.
5. Check installation wiring information for specific thermostat hookup. Refer to thermostat installation instructions for wiring to the unit. Thermostat wiring must be "Class 1" and voltage rating equal to or greater than unit supply voltage.
6. 24-v alarm signal shown. For dry alarm contact, cut JW1 jumper and dry contact will be available between AL1 and AL2.
7. Transformer secondary ground via Complete C board standoffs and screws to control box. (Ground available from top two standoffs as shown.)
8. Aquastat is supplied with unit and must be wired in series with the hot leg to the pump. Aquastat is rated for voltage up to 277 v.
9. Place jumpers on 2 and 3, ICM board, when dehumidification mode is used.

TYPICAL FACTORY-INSTALLED PREMIERLINK™ WIRING FOR WSHP UNITS

Application data

Aquazone™ water source heat pump products are available in a flexible, efficient array of models, which can be used in all types of water loop, ground water, and ground loop type systems. Utilize Aquazone products to provide optimal energy efficient solutions and adapt to the most challenging design requirements.

Water loop system

Water loop (or boiler/tower) system applications typically include a number of units plumbed to a common piping system. For optimal performance, this system should be designed between 2.25 and 3 gpm per ton of cooling capacity. The system is comprised of highly efficient packaged reverse cycle heat pump units interconnected by a water loop. The water circuit serves as both a sink and source for heat absorption and rejection and is designed for entering water temperatures between 60 F and 90 F. Within this temperature range units can heat or cool as required from the same water source. Transferring heat from warm to cold spaces in the building, whenever they coexist, conserves energy rather than creating new heat.

Refer to the **Carrier Water Source Heat Pump System Design Guide** for assistance with the design of water loop systems. The guide includes a practical approach for the latest and most current design recommendations including:

- product application, including horizontal, vertical, console, rooftop and water-to-water applications
- ventilation methods and system design, including energy recovery
- acoustical considerations for different product types
- addressing IAQ issues such as condensate removal and humidity control
- air distribution design including diffuser selection/layout and ductwork design
- hydronic system design including pipe sizing/layout and boiler/tower sizing
- control configurations such as standalone, DDC, DCV, and VVT®
- Water Source Heat Pump Efficiency/Operational Cost Comparison chart
- system variations such as a system without a boiler, variable pumping, and VAV for interior use

Ground water systems

To utilize Aquazone units in ground water applications, extended range should be specified. This will provide factory-installed insulation on the coaxial coil to prevent condensate from dripping when entering water temperatures are below 60 F. In addition, the copper coaxial coil installed on the Aquazone units may not be suitable for all water conditions. Refer to the Water Conditioning section for proper coaxial coil material selection.

Surface water system — This system is typically located near a lake or pond. In this application, the loop can be submerged in a series of coils beneath the water surface. The number of coils required depends on system load and design. This application requires minimum piping and excavation.

Open loop system — This system is used where ground water is plentiful. In this application, ground water is pumped through supply piping from the well to the building. The water is then pumped back into the ground through a discharge well as it leaves the building. An additional heat exchanger is usually installed between the building water piping system and the ground water piping system. This design limits the amount of piping and excavation required.

Aquazone units are provided with a standard TXV and are rated to extremely low temperatures to self-adjust the refrigeration circuit, therefore water regulating valves are not required on open loop systems. To conserve water on this type of system, a slow opening/closing solenoid valve is recommended.

Ground loop systems

There are many commonly specified designs for ground loop applications. Typical designs include vertical loops and horizontal loops. In some applications, water is piped from the ground or lake directly to the water source heat pump. Piping is limited to the amount of pipe required to get the water from the source to the unit.

NOTE: When utilizing Aquazone water source heat pumps in ground loop systems, refer to design considerations in the ground water system section.

Horizontal ground loop — This system is used when adequate space is available and trenching can be easily accomplished. A series of parallel pipes are laid out in trenches 3 to 6 ft below the ground surface, and then back-filled. Often, multiple pipes are used to maximize the heat transfer capability of each trench. The amount of pipe and the size of the ground loop field are based on ground conditions, heating, and cooling requirements of the application and system design.

Vertical ground loop — This system is used in vertical borehole applications. This design is well suited for retrofit applications when space is limited or where landscaping is already complete and minimum disruption of the site is desired. The vertical ground loop system contains a single loop of pipe inserted into a hole. The hole is back-filled and grouted after the pipe is inserted. The completed loop is concealed below ground. The number of loops required depends on ground conditions, heating and cooling requirements, and the depth of each hole.

Hybrid systems — In some applications, it may be beneficial to incorporate a cooling tower into the ground loop system to reduce the overall cost. A hybrid system discards excess heat into the air and increases the cooling performance of the ground loop.

Application data (cont)

Condensate drainage

Venting — Condensate lines should be properly vented to prevent fan pressure from causing water to hang up in the piping. Condensate lines should be pitched to assure full drainage of condensate under all load conditions. Chemical treatment should be provided to remove algae in the condensate pans and drains in geographical areas that are conducive to algae growth.

Trapping — Condensate trapping is an essential necessity on every water source heat pump unit. A trap is provided to prevent the backflow of moisture from the condensate pan and into the fan intake or downstream into the mechanical system. The water seal or the length of the trap depends on the positive or negative pressure on the drain pan. As a rule of thumb, the water seal should be sized for 1 in. for every 1 in. of negative pressure on the unit. The water seal is the distance from the bottom of the unit condensate piping connection to the bottom of the condensate drain line run-out piping. Therefore, the trap size should be double the water seal dimension.

Horizontal units — Horizontal units should be sloped toward the drain at a $\frac{1}{4}$ in. per foot pitch. If it is not possible to meet the pitch requirement, a condensate pump should be designed and installed at the unit to pump condensate to a building drain. Horizontal units are not internally trapped; therefore an external trap is necessary. Each unit must be installed with its own individual trap and means to flush or blow out the condensate drain. The design of a common trap or vent for multiple units is not acceptable. The condensate piping system should not be designed with a pipe size smaller than the drain connection pipe size.

Vertical units — Vertical units utilize a condensate hose inside the cabinet that acts as a trapping loop, therefore an external trap is not necessary. Each unit must be installed with its own vent and means to flush or blow out the condensate drain lines. Do not install a common trap or vent on vertical units.

Water conditioning

In some applications, maintaining proper water quality may require the use of higher corrosion protection for the water-to-refrigerant heat exchanger. Water quality varies from location to location and is unique for each job. Water characteristics such as pH value, alkalinity, hardness, and specific conductance are of importance when considering any WSHP application. Water typically includes impurities and hardness that must be removed. The required treatment will depend on the water quality as well as type of system. Water problems fall into three main categories:

1. Scale formation caused by hard water reduces the heat transfer rate and increases the water pressure drop through the heat exchanger. As water is heated, minerals and salts are precipitated from a solution and deposited on the inside surface of the pipe or tube.
2. Corrosion is caused by absorption of gases from the air coupled with water on exposed metal. Corrosion is also common in salt-water areas.
3. Organic growths such as algae can reduce the heat transfer rate by forming an insulating coating on the inside tube surface. Algae can also promote corrosion by pitting.

NOTE: In most commercial water loop applications, Aquazone™ WSHP units use a copper water-to-refrigerant heat exchanger. Units can also be equipped with a cupronickel heat exchanger for applications where water is outside the standard contaminant limits for a copper heat exchanger.

WATER QUALITY GUIDELINES

CONDITION	HX MATERIAL*	CLOSED RECIRCULATING†	OPEN LOOP AND RECIRCULATING WELL**
Scaling Potential — Primary Measurement			
Above the given limits, scaling is likely to occur. Scaling indexes should be calculated using the limits below.			
pH/Calcium Hardness Method	All	N/A	pH < 7.5 and Ca Hardness, <100 ppm
Index Limits for Probable Scaling Situations (Operation outside these limits is not recommended.)			
Scaling indexes should be calculated at 150 F for direct use and HWG applications, and at 90 F for indirect HX use. A monitoring plan should be implemented.			
Ryznar Stability Index	All	N/A	6.0 - 7.5 If >7.5 minimize steel pipe use.
Langelier Saturation Index	All	N/A	-0.5 to +0.5 If <-0.5 minimize steel pipe use. Based upon 150 F HWG and direct well, 85 F indirect well HX.
Iron Fouling			
Iron Fe ²⁺ (Ferrous) (Bacterial Iron Potential)	All	N/A	<0.2 ppm (Ferrous) If Fe ²⁺ (ferrous) >0.2 ppm with pH 6 - 8, O ₂ <5 ppm check for iron bacteria.
Iron Fouling	All	N/A	<0.5 ppm of Oxygen Above this level deposition will occur.
Corrosion Prevention††			
pH	All	6 - 8.5 Monitor/treat as needed.	6 - 8.5 Minimize steel pipe below 7 and no open tanks with pH <8.
Hydrogen Sulfide (H ₂ S)	All	N/A	<0.5 ppm At H ₂ S>0.2 ppm, avoid use of copper and cupronickel piping or HXs. Rotten egg smell appears at 0.5 ppm level. Copper alloy (bronze or brass) cast components are okay to <0.5 ppm.
Ammonia Ion as Hydroxide, Chloride, Nitrate and Sulfate Compounds	All	N/A	<0.5 ppm
Maximum Chloride Levels	Copper CuproNickel 304 SS 316 SS Titanium	N/A N/A N/A N/A N/A	Maximum allowable at maximum water temperature.
			50 F (10 C) 75 F (24 C) 100 F (38 C)
			<20 ppm NR NR
			<150 ppm NR NR
			<400 ppm <250 ppm <150 ppm
			<1000 ppm <550 ppm <375 ppm
Erosion and Clogging			
Particulate Size and Erosion	All	<10 ppm of particles and a maximum velocity of 6 fps. Filtered for maximum 800 micron size.	<10 ppm (<1 ppm "sandfree" for reinjection) of particles and a maximum velocity of 6 fps. Filtered for maximum 800 micron size. Any particulate that is not removed can potentially clog components.
Brackish	All	N/A	Use cupronickel heat exchanger when concentrations of calcium or sodium chloride are greater than 125 ppm are present. (Seawater is approximately 25,000 ppm.)

LEGEND

HWG — Hot Water Generator

HX — Heat Exchanger

N/A — Design Limits Not Applicable Considering Recirculating Potable Water

NR — Application Not Recommended

SS — Stainless Steel

*Heat exchanger materials considered are copper, cupronickel, 304 SS (stainless steel), 316 SS, titanium.

†Closed recirculating system is identified by a closed pressurized piping system.

**Recirculating open wells should observe the open recirculating design considerations.

††If the concentration of these corrosives exceeds the maximum allowable level, then the potential for serious corrosion problems exists.

Sulfides in the water quickly oxidize when exposed to air, requiring that no agitation occur as the sample is taken. Unless tested immediately at the site, the sample will require stabilization with a few drops of one Molar zinc acetate solution, allowing accurate sulfide determination up to 24 hours after sampling. A low pH and high alkalinity can cause system problems, even when both values are within ranges shown. The term pH refers to the acidity, basicity, or neutrality of the water supply. Below 7.0, the water is considered to be acidic. Above 7.0, water is considered to be basic. Neutral water contains a pH of 7.0.

To convert ppm to grains per gallon, divide by 17. Hardness in mg/l is equivalent to ppm.

Application data (cont)

Acoustical design

Sound power levels represent the sound as it is produced by the source, the WSHP unit, with no regard to attenuation between the source and the space. Acoustical design goals are necessary to provide criteria for occupied spaces where people can be comfortable and communicate effectively over the background noise of the air-conditioning system and other background noise sources.

Acoustical design goals are desirable sound pressure levels within a given conditioned space and are represented by Noise Criteria (NC) curves. Noise Criteria (NC) curve levels represent a peak over a full spectrum of frequencies. A high value in a low frequency band has the same effect on NC level as a lower value in a high frequency band. It is important that sound levels be balanced over the entire spectrum relative to the NC curve. The lower the NC criteria curve, the more stringent the room acoustical design must be to meet the design goals.

It is important to know how to convert NC levels from the unit ratings in terms of sound power (L_w). This conversion depends on the specifics of the acoustical environment of the installation.

The resulting calculations are compared to the NC curve selected for the area to assess the acoustical design.

Some of the factors that affect conversion of sound power to sound pressure and consequent NC level include:

- type of acoustical ceiling
- use of metal or flex duct
- absorption in the occupied space
- location in the occupied space
- open or closed layout plan
- use of open or ducted returns
- orientation of unit to occupant
- use of lined or unlined duct

WSHP sound control

The analysis of the projected sound level in the conditioned space caused by a WSHP unit located in a ceiling plenum is quite involved. The key is to have good sound power ratings (L_w) in dB on the equipment to determine the sound attenuation effect of the ductwork, ceiling and room. In combination with utilizing standard Aquazone™ equipment attenuating features or the advanced mute package features, suggestions for horizontal and vertical unit sound design are provided to design around the WSHP units.

Horizontal units

Use the following guidelines for layout of Aquazone horizontal units to minimize noise:

1. Obtain sound power ratings in accordance with latest standards from manufacturers to select quietest equipment.
2. Do not locate units over a space with a required NC of 40 or less. Instead, locate units above less sensitive noise areas such as above or in equipment rooms, utility closets, restrooms, storage rooms, or above corridors.
3. Provide at least 10 feet between WSHP units to avoid the additive effect of two noise sources.

4. Provide an acoustical pad underneath the WSHP unit in applications where the unit must be mounted above noise sensitive areas such as private offices or conference rooms. The pad attenuates radiated noise. Be sure the pad has an area at least twice that of the WSHP footprint.
5. Maximize the installed height above the suspended ceiling.
6. Be sure the WSHP unit is located at least 6 feet away from any ceiling return grille to prevent line-of-sight casing noise to reach the space below.
7. Suspend the WSHP unit from the ceiling with hangers that utilize spring or neoprene type isolators to reduce vibration transmission.
8. Utilize flexible electrical connections to the WSHP unit. DO NOT USE RIGID CONNECTIONS.
9. Utilize flexible loop water and condensate piping connections to the WSHP unit.
10. Use a canvas duct connector to connect the WSHP discharge to the downstream duct system. This reduces vibration-induced noise.
11. Provide acoustic interior lining for the first 20 feet of discharge duct, or until the first elbow is reached. The elbow prevents line-of-site sound transmission in the discharge duct.
12. Provide turning vanes in ductwork elbows and tees to reduce air turbulence.
13. Size the sheet metal supply duct with velocities no greater than 1000 fpm.
14. Ensure ductwork is rigid.
15. Use round duct whenever possible to further reduce noise.
16. Allow at least 3 equivalent duct diameters of straight duct upstream and downstream of the unit before allowing any fittings, transitions, etc.
17. Seal all penetrations around duct entering the space.
18. Provide a 4-ft. run-out duct made of flexible material to connect a diffuser to the supply trunk duct. The flex duct provides an "attenuating end-effect" and reduces duct-transmitted sound before it reaches the space. Typically a 6 db sound reduction can be accomplished with the use of flex duct.
19. Locate the run-out duct balancing damper as far away from the outlet diffuser as possible. Locating the balancing damper at the trunk duct exit is the best location.
20. If return air is drawn through a ceiling plenum, provide an acoustically lined return duct elbow or "L" shaped boot at the WSHP to eliminate line-of-sight noise into the ceiling cavity and possible through ceiling return air grilles. Face the elbow or boot away from the nearest adjacent WSHP unit to prevent additive noise.
21. Do not hang suspended ceiling from the ductwork.

Vertical units

All guidelines established for horizontal units also apply for vertical units. In addition, since vertical units tend to be installed in small equipment rooms or closets, the following additional guidelines apply:

1. Mount the unit on a pad made of high-density sound absorbing material such as rubber or cork. Extend the pad beyond the WSHP unit footprint by at least 6 inches in each direction.
2. Since the unit returns airflow through a grille mounted in a closet door, provide a sound barrier or some other modification of the closet to prevent line-of-site noise into the space.
3. Follow good duct design practice in sizing and locating the connection of the WSHP discharge to the supply duct system. Use an elbow with turning vanes and bent in the direction of the fan rotation to minimize turbulence. Make any duct transitions as smooth and as gradual as possible to again minimize turbulence and loss of fan static pressure.

Solenoid valves

In applications using variable flow pumping, solenoid valves can be field installed and operated from the control board in the Aquazone™ WSHP unit.

Freeze protection

Applications where systems are exposed to outdoor temperatures below freezing (32 F) must be protected from freezing. The most common method of protecting water systems from freezing is adding glycol concentrations into the water. Design care should be used when selecting both the type and concentrations of glycol utilized due to the following:

- Equipment and performance may suffer with high concentrations of glycol and other antifreeze solutions.
- Loss of piping pressure may increase greatly, resulting in higher pumping costs.
- Higher viscosity of the mixture may cause excess corrosion and wear on the entire system.
- Acidity of the water may be greatly increased, promoting corrosion.
- Glycol promotes galvanic corrosion in systems of dissimilar metals. The result is corrosion of one metal by the other, causing leaks.

Dehumidification

For dehumidification, Carrier has provided a modulating hot water reheat (HWR) function that meets and exceeds those specifications that call for hot gas reheat (HGR). Modulating HWR is a relatively new design that controls de-humidification by providing modulating HWR based on the desired leaving air temperature set point. Unlike the complicated refrigerant circuitry used in HGR, Carrier's HWR utilizes the condenser water and a water-to-air reheat coil, placed after the evaporator coil, to reheat the return air after it is conditioned by the air-to-refrigerant evaporator coil, providing 100% reheat regardless of season and water temperature.

Heat pumps with HWR having a sensible-to-total (S/T) ratio of .72 to .76 dedicate 25% of their total cooling capacity to moisture removal. When selecting a unit for both sensible and latent cooling, it is necessary to pay close attention to the latent cooling of the unit to ensure that the latent cooling load is satisfied by the unit selection. If the latent cooling load is not satisfied, then a larger unit with enough latent cooling is required for that specific application.

Unlike most hot gas reheat options, the HWR option will operate over a wide range of entering-water temperatures (EWTs). Special flow regulation (water regulating valve) is not required for low EWT conditions. However, below 55 F, supply-air temperatures cannot be maintained at 72 F because the cooling capacity exceeds the reheat coil capacity at low water temperatures. Below 55 F, essentially all water is diverted to the reheat coil (no heat of rejection to the building loop). Although the HWR option will work fine with low EWTs, overcooling of the space may result with well water systems or, on rare occasions, with ground loop (geothermal) systems (NOTE: Extended range units are required for well water and ground loop systems.). Since dehumidification is generally only required in cooling, most ground loop systems will not experience overcooling of the supply-air temperature. If overcooling of the space is a concern (e.g., computer room well water application), auxiliary heating may be required to maintain space temperature when the unit is operating in the dehumidification mode. Water source heat pumps with HWR should not be used as makeup air units. These applications should use equipment specifically designed for makeup air.

Guide specifications

Single-Stage Water Source Heat Pumps with Puron® Refrigerant

HVAC Guide Specifications

Size Range: **17,300 to 77,100 Btuh**

Cooling Capacity

13,400 to 85,800 Btuh

Heating Capacity

Carrier Model Number: **50PSH, 50PSV, 50PSD**

Part 1 — General

1.01 SYSTEM DESCRIPTION

- A. Furnish and install Carrier water source heat pumps, with Puron refrigerant as indicated on the plans.
- B. Equipment shall be completely assembled, piped and internally wired. Capacities and characteristics as listed in the schedule and the guide specifications that follow.

1.02 QUALITY ASSURANCE

- A. All equipment listed in this section must be rated and certified in accordance with ARI/ISO and ETL listed to UL standard 1995. The units shall have ARI/ISO and ETL labels.
- B. All units shall be fully quality tested by factory run testing under normal operating conditions and water flow rates as described herein. Quality control system shall automatically perform via computer: triple leak check, pressure tests, evacuate and accurately charge system, perform detailed heating and cooling mode tests, and quality cross check all operational and test conditions to pass/fail data base. A detailed report card will ship with each unit displaying all test performance data.

NOTE: If unit fails on any cross check, system shall not allow unit to ship.

- C. Serial numbers will be recorded by factory and furnished to contractor on report card for ease of unit warranty status. Units tested without water flow are not acceptable. Units shall be prewired and pre-charged in factory.

Part 2 — Product

2.01 EQUIPMENT

A. General:

Units shall be supplied completely factory built for an entering water temperature range from 60 to 95 F as standard. Equivalent units from other manufacturers can be proposed provided approval to bid is given 10 days prior to bid closing.

B. Unit Cabinets:

1. Horizontal Units:

- a. Horizontal units shall have one of the following airflow arrangements: Left Inlet/Right Discharge; Right Inlet/Left Discharge; Left Inlet/Back Discharge; or Right Inlet/Back Discharge as shown on the plans.
- b. Horizontal units must have the ability to be field convertible from side to back or back to

side discharge with no additional parts or unit structure modification. Units will have factory-installed hanger brackets with rubber isolation grommets packaged separately.

2. Vertical Units:

Vertical units shall have one of the following air flow arrangements: Left Return/Top Discharge, Right Return/Top Discharge, Left Return/Bottom Discharge, Right Return/Bottom Discharge as shown on the plans.

3. If units with these arrangements are not used, the contractor is responsible for any extra costs incurred by other trades.
4. All units (horizontal and vertical) must have a minimum of three access panels for serviceability of compressor compartment. Units having only one access panel to compressor, heat exchangers, expansion device, or refrigerant piping shall not be acceptable.
5. Standard cabinet panel insulation must meet NFPA 90A requirements, air erosion and mold growth limits of UL-181, stringent fungal resistance test per ASTM C1071 and ASTM G21, and shall meet zero level bacteria growth per ASTM G22. Unit insulation must meet these stringent requirements or unit(s) will not be accepted.
6. Cabinets shall have separate holes and knock-outs for entrance of line voltage and low voltage control wiring.
7. All factory-installed wiring passing through factory knockouts and openings shall be protected from sheet metal edges at openings by plastic ferrules.
8. Contractor must ensure that units can be easily removed for servicing and coordinate locations of electrical conduit and lights with the electrical contractor.

C. Compressor:

1. Compressor section interior surfaces shall be lined with $\frac{1}{2}$ inch thick, dual density, $1\frac{3}{4}$ lb per cubic ft acoustic type fiberglass insulation. Air-handling section interior surfaces shall be lined with $\frac{1}{2}$ in. thick, single density, $1\frac{3}{4}$ lb per cubic ft foil-backed fiber insulation for ease of cleaning.
2. Insulation placement shall be designed in a manner that will eliminate any exposed edges to prevent the introduction of glass fibers into the airstream. Units without foil-backed insulation in the air-handling section will not be accepted.
3. The compressor shall have a dual level vibration isolation system.
4. The compressor will be mounted on computer-selected vibration isolation springs to a large heavy gage compressor mounting tray plate, which

is then isolated from the cabinet base with rubber grommets for maximized vibration attenuation.

5. Compressor shall be located in an insulated compartment away from airstream to minimize sound transmission.
6. Compressor shall have thermal overload protection.
7. The heat pumps shall be fabricated from heavy gage G90 galvanized steel with powder coat paint finish. Both sides of the steel shall be painted for added protection.
8. All units must have an insulated panel separating the fan compartment from the compressor compartment.
9. Units with the compressor in the airstream are not acceptable.

D. Fan and Motor Assembly:

1. Blower shall have inlet rings to allow removal of wheel and motor from one side without removing housing.
2. The fan motor shall be 3-speed, permanently lubricated, PSC (permanent split capacitor) type with internal thermal overload protection.
3. The fan motor shall be isolated from the housing by rubber grommets.
4. The motor shall be permanently lubricated and have thermal overload protection.
5. A special dehumidification mode shall be provided to allow lower airflows in cooling for better dehumidification. The dehumidification mode shall be selectable via a jumper on the control board or may be controlled externally from a humidistat.
6. Airflow/static pressure rating of the unit shall be based on a wet coil and a clean filter in place. Ratings based on a dry coil and/or no filter, or on an ESP (external static pressure) less than 0.50 in. wg shall NOT be acceptable.

E. Refrigerant Circuit:

1. All units shall contain a Puron® (R-410A) sealed refrigerant circuit including a high-efficiency Copeland UltraTech™ single-stage compressor designed for heat pump operation, a thermostatic expansion valve for refrigerant metering, an enhanced corrugated aluminum lanced fin and rifled copper tube refrigerant to air heat exchanger, reversing valve, coaxial (tube in tube) refrigerant to water heat exchanger, and safety controls, including a high-pressure switch, low-pressure switch (loss of charge), water coil low temperature sensor, and air coil low temperature sensor.
2. Access fittings shall be factory-installed on high and low pressure refrigerant lines to facilitate field service.
3. Refrigerant metering shall be accomplished by thermostatic expansion valve only.

F. Drain Pan:

1. The drain pan shall be constructed of 304 Stainless Steel to inhibit corrosion. This corrosion protection system shall meet the stringent 1000-hour salt spray test per ASTM B117. If plastic type material is used, it must be HDPE (high-density polyethylene) to avoid thermal cycling shock stress failure over the lifetime of the unit.
2. Drain pan shall be fully insulated.
3. Drain outlet shall be located at pan as to allow complete and unobstructed drainage of condensate. Drain outlet for horizontal units shall be connected from pan directly to FPT fitting. No hidden internal tubing extensions from pan outlet extending to unit casing (that can create drainage problems) will be accepted.
4. The unit as standard will be supplied with solid-state electronic condensate overflow protection. Mechanical float switches will NOT be accepted.
5. Vertical units shall be furnished with a PVC slip condensate drain connection and an internal factory-installed condensate trap. If units without an internal trap are used, the contractor is responsible for any extra costs to field install these provisions, and/or the extra costs for the subcontractor to install these provisions.

G. Filter:

1. Units shall have a factory-installed 1 in. wide filter bracket for filter removal from either side. Units shall have a 1 in. thick throwaway type fiberglass filter.
2. The contractor shall purchase one spare set of filters and replace factory shipped filters on completion of start-up.
3. Filters shall be standard sizes. If units utilize non-standard filter sizes, then the contractor shall provide 12 spare filters for each unit.

H. Thermostatic Expansion Valve:

1. Expansion valves shall be dual port balanced types with external equalizer for optimum refrigerant metering.
2. Units shall be designed and tested for operating ranges of entering water temperatures from 20 to 120 F.
3. Reversing valve shall be four-way solenoid activated refrigerant valve, which shall default to heating mode should the solenoid fail to function. If the reversing valve solenoid defaults to cooling mode, an additional low temperature thermostat must be provided to prevent overcooling an already cold room.

I. Controls and Safeties:

1. Electrical:
 - a. A control box shall be located within the unit compressor compartment and shall contain a

Guide specifications (cont)

- 50 va transformer, 24-volt activated, 2 or 3-pole compressor contactor, terminal block for thermostat wiring and solid-state controller for complete unit operation.
- b. Reversing valve and fan motor wiring shall be routed through this electronic controller.
 - c. Units shall be name-plated for use with time-delay fuses or HACR circuit breakers. Unit controls shall be 24-volt and provide heating or cooling as required by the remote thermostat/sensor.
2. Piping:
- a. Supply and return water connections shall be copper FPT fittings and shall be securely mounted flush to the cabinet corner post allowing for connection to a flexible hose without the use of a back-up wrench.
 - b. All water connections and electrical knock-outs must be in the compressor compartment corner post as to not interfere with the serviceability of unit. Contractor shall be responsible for any extra costs involved in the installation of units that do not have this feature.
3. Unit Controls:
- a. Safety controls including a high-pressure switch, a low-pressure sensor, and a low water and low air temperature sensor. Access fittings shall be factory installed on high and low pressure refrigerant lines to facilitate field service.
 - b. Activation of any safety device shall prevent compressor operation via a microprocessor lockout circuit. The lockout shall be reset at the thermostat or at the contractor-supplied disconnect switch.
 - c. Units which may be reset only at the disconnect switch only shall not be acceptable.
4. The standard Complete C electronic control system shall interface with a heat pump (Y,O) wall thermostat (mechanical or electronic). The control system microprocessor board shall be specifically designed to protect against building electrical system noise contamination, EMI, and RFI interference. The control system shall have the following features:
- a. 50 va transformer.
 - b. Performance Monitor (PM). The PM warns when the heat pump is running inefficiently.
 - c. Anti-short cycle time delay on compressor operation time delay shall be 5 minutes minimum.
 - d. Random start on power up mode.
 - e. Low voltage protection.
 - f. High voltage protection.
 - g. Unit shutdown on high or low refrigerant pressures.
- h. Unit shutdown on low water temperature.
 - i. Water coil freeze protection (selectable for water or antifreeze).
 - j. Air coil freeze protection (check filter switch).
 - k. Condensate overflow shutdown.
 - l. Option to reset unit at thermostat or disconnect. Fault type shall be retained in memory if reset at thermostat.
 - m. Automatic intelligent reset. Unit shall automatically reset 5 minutes after trip if the fault has cleared. Should a fault reoccur 3 times sequentially, lockout requiring manual reset will occur.
 - n. Ability to defeat time delays for servicing.
 - o. Light-emitting diodes (LED) to indicate high pressure, low pressure, low voltage, high voltage, air/water freeze protection, condensate overflow and control status.
 - p. The low-pressure switch SHALL NOT be monitored for the first 90 seconds after a compressor start command to prevent nuisance safety trips.
 - q. Remote fault type indication at thermostat.
 - r. Selectable 24-v or pilot duty dry contact alarm output.
 - s. 24-v output to cycle a motorized water valve with compressor contactor.
 - t. Electric heat output to control two stages of electric heat (emergency heat).
 - u. Service test mode for troubleshooting and service.
 - v. Unit Performance Sentinel (UPS). The UPS warns when the heat pump is running inefficiently.
- Units not providing the 8 safety protections of anti-short cycle, low voltage, high voltage, high refrigerant pressure, low pressure (loss of charge), air coil freeze, water coil freeze, and condensate overflow protections will not be accepted.
5. Optional electronic Deluxe D control shall have all the features of the Complete C control with the following additional features:
- a. 75 va transformer.
 - b. A removable thermostat connector.
 - c. Random start on return from night setback.
 - d. Intelligent reversing valve operation for extended life and quiet operation.
 - e. Night setback control from low temperature thermostat, with 2-hour override initiated by a momentary signal from the thermostat.

- f. Dry contact night setback output for digital night setback thermostats.
 - g. Ability to work with heat/cool (Y, W) thermostats.
 - h. Ability to work with heat pump thermostats using O or B reversing valve control.
 - i. Single grounded wire to initiate night setback, or emergency shutdown.
 - j. Boilerless system control can switch automatically to electric heat at low loop water temperature.
 - k. Dehumidistat input providing fan control for dehumidification operation via the IdealHumidity™ system.
 - l. Multiple units connected to one sensor providing communication for up to 3 water source heat pumps.
 - m. Selection of boilerless changeover temperature set point.
 - n. Compressor relay staging for dual stage units or in master/slave applications.
- Units not having automatic low sensible heat ratio cooling will not be accepted; as an alternate, a hot gas reheat coil may be provided with control system for automatic activation.
6. Carrier PremierLink™ Controller:
- This optional control will function with CCN (Carrier Comfort Network®) and ComfortVIEW™ software. It shall also be compatible with ComfortLink™ controllers. It shall be ASHRAE 62-99 compliant and Internet ready. It shall accept a CO₂ sensor in the conditioned space and be demand control ventilation (DCV) ready. The communication rate must be 38.4K or faster. It shall include an integrated economizer controller.
7. LONWORKS® Interface System:
- Units shall have all features listed above (either Complete C or Deluxe D) and the control board shall be supplied with a LONWORKS interface board, which is LONMark® certified. This will permit all units to be daisy chained via a 2-wire twisted pair shielded cable. The following points must be available at a central or remote computer location:
- a. space temperature
 - b. leaving-water temperature
 - c. discharge-air temperature
 - d. command of space temperature setpoint
 - e. cooling status
 - f. heating status
 - g. low temperature sensor alarm
 - h. low pressure sensor alarm
 - i. high pressure switch alarm
 - j. condensate sensor alarm
- k. high/low voltage alarm
 - l. fan "ON/AUTO" position of space thermostat
 - m. unoccupied / occupied command
 - n. cooling command
 - o. heating command
 - p. fan "ON/AUTO" command
 - q. fault reset command
 - r. itemized fault code revealing reason for specific shutdown fault (any one of 7)
- This option also provides the upgraded 75 va control transformer with load side short circuit and overload protection via a built in circuit breaker.
- J. Solid-State Permanent Split Capacitor (PSC) Fan Control Board:
1. Airflow selection shall be accomplished via 3 jumper switches on the PSC control board. Actual airflow shall be indicated by the cfm LED with each 100 cfm being represented by one flash of the LED.
 2. Airflow shall be automatically maintained ($\pm 5\%$) by the PSC motor regardless of external static pressure up to its maximum output capacity.
 3. A jumper shall allow selection of a special dehumidification mode, which reduces airflow in cooling by 25% to increase the latent capacity of the unit. A terminal shall be provided on the control board to allow an external humidistat to activate dehumidification mode.
- K. Remote Service Sentinel (Complete C/Deluxe D):
1. Solid-state control system shall communicate with thermostat to display (at the thermostat) the unit status, fault status, and specific fault condition, as well as retrieve previously stored fault that caused unit shutdown.
 2. The remote service sentinel allows building maintenance personnel or service personnel to diagnose unit from the wall thermostat.
 3. The control board shall provide a signal to the thermostat fault light, indicating a lockout.
 4. Upon cycling the G (fan) input 3 times within a 60-second time period, the fault light shall display the specific code as indicated by a sequence of flashes. A detailed flashing code shall be provided at the thermostat LED to display unit status and specific fault status such as over/under voltage fault, high pressure fault, low pressure fault, low water temperature fault, condensate overflow fault, etc.
 5. Units that do not provide this remote service sentinel shall not be acceptable.
- L. Special Features:
1. Factory-Installed Options:
 - a. Cupronickel coaxial water-to-refrigerant heat exchangers for higher corrosion protection.

Guide specifications (cont)

- b. Sound attenuation (mute) package consists of high technology sound attenuating materials strategically applied to the cabinet, in addition to the standard system, to further dampen sound.
 - c. Extended range for units operating with entering water temperatures below dew point. Extended entering water temperatures range from 20 to 120 F.
 - d. Two-way motorized water control valve shall operate in conjunction with the compressor to shut off or turn on water to the unit.
 - e. Water circuit options shall provide internally mounted 2.5 or 3.0 gpm per ton automatic flow regulating valves.
 - f. Hot water generator coil and high temperature switch shall generate hot water within the unit.
 - g. Permanent split capacitor (PSC) high-static blower motor shall increase unit capacity through the use of a high-static blower motor.
 - h. Electronically controlled motor (ECM) shall provide soft starting, maintain constant cfm over its static operating range and provide airflow adjustment on its control board.
 - i. Modulating hot water reheat (HWR), composed of supply air sensor, motorized valve, proportional controller, loop pump, and hydronic coil.
2. Field-Installed Accessories:
- a. Aquazone™ Thermostat Controls:
 - 1) Programmable multi-stage thermostat with 7-day clock, holiday scheduling, large backlit display and remote sensor capability.
 - 2) Programmable 7-day light-activated thermostat offers occupied comfort settings with lights on, unoccupied energy savings with lights off.
 - 3) Programmable 7-day flush-mount thermostat offers locking coverplate with tamper proof screws, flush to wall mount, dual point with adjustable deadband, O or B terminal, and optional remote sensor.
- 4) Programmable 5-day thermostat offers 2-stage heat/2-stage cool, auto changeover, 5-minute built-in compressor protection, locking cover included.
 - 5) Non-programmable thermostat with 2-stage heat/2-stage cool, auto changeover, 5-minute built-in compressor protection, locking cover included.
- b. Loop controller with six stages (2 stages for heating and 4 stages for heat rejection).
 - c. Filter rack (2 in.) to enhance the filtration system of the water source heat pump.
NOTE: Filter rack does not include filters.
- d. Fire-rated hoses kits with a fixed MPT on one end and a swivel with an adapter on the other end. Hose kits can be either stainless steel or galvanized.
 - e. Ball valves (brass body) for shut off and balancing water flow. Available with memory, with memory stop, and pressure temperature ports.
 - f. Y strainers (bronze body) "Y" type configuration with a brass cap. Maximum operating pressure rating of 450 psi. Strainer screen made of stainless steel.
 - g. Solenoid valves (brass body) provide slow operation for quiet system application.
 - h. Hose kit assemblies includes a ported ball valve with pressure temperature (P/T) plug ports, flexible stainless steel hose with swivel and nipple. Return hose includes a ball valve, preset measure flow (gpm) with two P/T ports, flexible stainless steel hose with a swivel and nipple.
 - i. Remote sensors for Aquazone flush-mount thermostats.
 - j. PremierLink™ accessories for providing a fully integrated DDC system. Accessories include supply air temperature sensors, communicating room sensors, CO₂ sensors, and linkage thermostats.
